(54) RUBBER MIXTURES FOR ROLLER COATINGS

(57) This invention relates to a rubber mixture containing a nitrile rubber, a metal salt of an acrylate, a liquid acrylate and optionally other additives, a process for its preparation, and use for all types of molded articles, in particular roller coatings.

Industrie Canada Industry Canada

Rubber mixtures for roller coatings**ABSTRACT OF THE DISCLOSURE**

This invention relates to a rubber mixture containing a nitrile rubber, a metal salt of an acrylate, a liquid acrylate and optionally other additives, a process for its preparation, and use for all types of molded articles, in particular roller coatings.

Rubber mixtures for roller coatings**FIELD OF THE INVENTION**

5 This invention relates to a rubber mixture containing a nitrile rubber, a metal salt of an acrylate, a liquid acrylate and optionally other additives, a process for its preparation, and use for all types of molded articles, in particular roller coatings.

BACKGROUND OF THE INVENTION

10

Rollers having a rubber coating are used in many fields, including the print and textile industry, in machines, such as, for example, fax machines and in the steel industry and paper industry.

15 Roller coatings are subjected to extreme stresses, particularly in the steel and paper industries. In such applications, the coatings are required to have a combination of the following properties:

- low compression set;
- 20 - low abrasion;
- little swelling in the media used;
- good resistance to heat and chemicals;
- excellent adhesion to the metal surface under the coating; and/or
- low build-up of heat under stress.

25

SUMMARY OF THE INVENTION

It has now been found that a rubber mixture which contains a nitrile rubber and, in addition, a metal salt of an acrylate and a liquid acrylate is particularly suitable as
30 raw material for rubber coatings for rollers.

This application accordingly provides a rubber mixture, containing

- a) one or more nitrile rubbers
- b) one or more metal salts of an acrylate
- 5 c) one or more liquid acrylates, optionally applied to a carrier, and
- d) optionally other additives and/or fillers.

Nitrile rubbers are meant to be diene-(meth)acrylonitrile copolymers. The preferred
dienes here are isoprene and, in particular, butadiene. The copolymers have a content
10 of copolymerized acrylonitrile units and/or methacrylonitrile units of 5 to 60 wt.%,
preferably 10 to 50 wt.%.

Moreover, the term explicitly includes hydrogenated nitrile rubbers. According to
this invention, "hydrogenated nitrile rubber" or "HNBR" means nitrile rubbers, the
15 C=C double bonds of which are selectively (that is, without hydrogenation of the
C≡N triple bond) partially or completely hydrogenated. Preferred hydrogenated ni-
trile rubbers are those having a degree of hydrogenation, based on the C=C double
bonds originating from the butadiene, of at least 75%, preferably of at least 95%, in
particular of at least 98%. The degree of hydrogenation can be determined by NMR
20 spectroscopy and IR spectroscopy.

The hydrogenation of nitrile rubber is known: U.S. Patent No. 3,700,637, DE-A
2,539,132, DE-A 3,046,008, DE-A 3,046,251, DE-A 3,227,650, DE-A 3,329,974,
EP-A 111,412, FR-B 2,540,503. Hydrogenated nitrile rubbers are distinguished by
25 having high tensile strength, low abrasion, low residual deformation after compres-
sive stress and tensile load and good resistance to oil, but primarily by a notable re-
sistance to thermal and oxidative influences. Accordingly, hydrogenated nitrile rub-
bers are preferred in this invention.

30 Suitable nitrile rubbers generally have Mooney viscosities (DIN 53 523, ML 1+4) of
25 to 100 Mooney units, in particular 40 to 80 Mooney units.

The addition of metal salts of an acrylate to mixtures containing nitrile rubbers is known. Suitable acrylates may be unsubstituted or substituted. Methacrylates are an example of substituted acrylates.

5

The person skilled in the art knows of suitable acrylates from EP-A1 0,319,320, in particular page 3, lines 16 to 35; from U.S. Patent No. 5,208,294, in particular column 2, lines 25 to 40 and from U.S. Patent No. 4,983,678, in particular column 2, lines 45 to 62. Zinc acrylate, zinc diacrylate and zinc dimethylacrylate, in particular,
10 are mentioned there.

It may be advantageous to use the metal salt of the acrylate together with a scorch retarder. Suitable examples here are hindered phenols, such as methyl-substituted aminoalkylophenols, in particular 2,6-ditert.-butyl-4-(dimethylamino)phenol.

15

The liquid acrylate may be any acrylate which is known to the person skilled in the art and is in liquid form at room temperature.

20

Trimethylolpropane trimethacrylate (TRIM), butanediol dimethacrylate (BDMA) and ethylene glycol dimethacrylate (EDMA) are particularly preferred.

25

In order to achieve an improved incorporation, it may be advantageous to use the liquid acrylate bound to a carrier. Examples of suitable carriers are silicates, precipitated silicas, clays, carbon black, talc or polymers. In general, mixtures containing 5
25 to 50 wt.% carrier are used.

30

Other suitable additives include those known to the person skilled in the art, for example, vulcanization activators, in particular metal oxides, such as zinc oxide or magnesium oxide, antidegradants, such as alkyl-substituted diphenylamines, mercaptobenzimidazoles, unsaturated ethers, such as Vulkazon® AFD (Bayer AG, D) or

cyclic, unsaturated acetals, such as Vulkazon® AFS/LG (Bayer AG, D). The following may also be mentioned as additives:

- 5 - plasticizers, in particular carboxylic esters, as well as sebacic acid and its derivatives or trimellitic acid and its derivatives
- processing aids, in particular stearic acid and its derivatives, such as zinc stearate, or polymers, such as poly(ethylene vinyl acetate) (Levapren® from Bayer AG, D) or poly(ethylene vinyl acrylate)VAMAC® from DuPont).

10

It may also be advantageous to introduce fillers into the rubber mixture according to the present invention. These may be non-reinforcing or reinforcing.

Examples of fillers which may be mentioned are:

15

- carbon blacks, such as MT, GPF, SRF blacks and primarily FEF blacks;
- metal oxides, such as titanium dioxide (primarily as white pigment);
- 20 - silicates, such as sodium aluminium silicate;
- silicas, in particular precipitated silicas;

25 To improve the abrasion, so-called active fillers in accordance with the DIN 66131 are preferred, published, for example, on page 535 of "Handbuch für die Gummiindustrie", Bayer AG, 1992, Leverkusen.

- Clays, mica, talc.

- 5 -

In addition, it may be advantageous to use extra activators in order to improve the adhesion between filler and rubber, such as, for example, silanes, such as Silquest® RC-1 (Union Carbide, US). Pigments may also be added.

- 5 The quantities of the individual components of the mixture depend on the intended use of the mixture and can be determined by a few preliminary tests.

The materials are generally used in the following quantities (in each case, in phr = per hundred parts of rubber):

10

- metal salt of an acrylate: 10 to 120 phr, preferably 10 to 85 phr, most preferably, 20 to 65 phr,

15

- liquid acrylate: 5 to 80 phr, preferably 20 to 60 phr, in each case calculated without carrier,

- antidegradant: 0 to 4 phr,

- retarder: 0 to 2 phr,

20

- metal oxides, such as ZnO: 0 to 30 phr,

- fillers: 0 to 150 phr, preferably active fillers,

25

- plasticizer: 0 to 20 phr,

- processing aids: 0 to 2 phr.

30

The invention also provides crosslinkable mixtures containing the rubber mixtures according to the present invention, as well as a process for the preparation of the rub-

ber mixtures according to the present invention and of cross-linkable rubber mixtures, characterized in that the components are mixed in a mixing unit.

5 In order to produce crosslinkable mixtures from the mixtures according to the present invention, crosslinking agents are added to the rubber mixtures according to the present invention. Peroxide systems are suitable crosslinking agents.

10 Preferred peroxide systems include dialkyl peroxides, ketal peroxides, aralkyl peroxides, peroxide ethers, peroxide esters, such as, for example: di-tert.-butyl peroxide, bis(tert.-butylperoxyisopropyl)benzene, dicumyl peroxide, 2,5-dimethyl-2,5-di(tert.-butylperoxy)hexane, 2,5-dimethyl-2,5-di(tert.-butylperoxy)-3-hexene, 1,1-bis(tert.-butylperoxy)-3,3,5-trimethylcyclohexane, benzoyl peroxide, tert.-butyl cumyl peroxide and tert.-butyl perbenzoate.

15 The quantities of peroxide are within the range of 1 to 10 phr, preferably within the range of 4 to 8 phr, based on rubber. The cross-linking can be effected at temperatures of 100°C to 200°C, preferably 130°C to 180°C, optionally at a pressure of 10 to 200 bar. Subsequent to the crosslinking, the vulcanizates can be post-cured by being stored at elevated temperature.

20 The peroxides can advantageously also be used in polymer-bound form. Appropriate systems are commercially available, for example, Poly-Dispersion® T (VC) D-40 P from Rhein Chemie Rheinau GmbH, D (= polymer-bound di-tert.-butylperoxyisopropylbenzene).

25 The crosslinking can also be achieved by high-energy radiation.

30 Crosslinking according to the present invention means that less than 10 wt.%, preferably less than 5 wt.%, based on rubber, is extractable during extraction for 10 hours in a Soxhlet attachment with toluene as extracting agent.

The optimal quantity of crosslinking agent is easily determined by preliminary experiments.

Any apparatus for mixing rubbers which is known to the person skilled in the art may
5 be used as the mixing apparatus, in particular internal mixer, open mills and screw-type machines.

Here, care should be taken to ensure that the rubber is not degraded during the mixing procedure. It may be advantageous to cool the mixture during the mixing procedure.
10 In order to avoid scorch, the peroxide is frequently added as the last component, optionally in a separate mixing procedure.

The invention also provides the use of the rubber mixtures according to the present invention for the production of all types of molded articles, in particular coatings for
15 rollers, most particularly rollers for the paper, textiles, printing and steel industries.

Rollers generally consist of a metal core having a variable diameter, metal cores with a diameter of 1 to 5 m being preferred. The metal core generally consists of steel of various compositions, onto which the crosslinkable rubber mixture is drawn by
20 means of conventional prior art methods and subsequently cross-linked. A good adhesion of coating to metal and inside the coating is crucial here. It may be advantageous to improve the adhesion of coating to metal by means of adhesion promoters, such as dispersions/solutions of halogenated polymers, optionally with crosslinking agents/fillers/pigments. These substances are commercially available.

25

The rubber mixtures according to the present invention are particularly suitable for use on rollers, as in the crosslinked condition they combine an excellent hardness in the range above 20 Shore D (DIN 53 505), even at elevated service temperatures, with a good resistance to abrasion, heat, water and chemicals. This balanced range of
30 properties is not achieved in prior art. The rubber mixtures according to the present

- 8 -

invention are, of course, also suitable for the production of other molded articles, such as profiles, belts, rings, seals, damping elements, etc.

5 Accordingly, molded articles, in particular rollers and belts, obtainable using a rubber mixture according to the present invention are also provided by the invention.

To the person skilled in the art, it is a trivial matter to modify specifically the properties of the mixtures according to the present invention by adding other polymers, such as BR, NR, IIR, IR, EPDM, EPM, CR, SBR, AEM, ACM or fluoropolymers.

10

The following Examples are intended to illustrate the invention, without thereby limiting it.

ExamplesA. Methods of measurement

5	Residual double-bond content	IR spectroscopy
	Mooney viscosity	ASTM D 1646 (given in Mooney
	(ML 1+4 (100°C))	units)
	Volatile constituents (wt.%)	ASTM D 1416
	Ash content (wt.%)	ASTM D 1416
10	Acrylonitrile (ACN) content	in accordance with the
	(wt.% bound in the polymer)	instructions below.

B. Brief description of the method

- 15 In the analysis, the rubber is pyrolyzed at 900°C on a catalyst in a stream of oxygen. The unused oxygen is absorbed on a copper reduction reactor and the NO_x gases formed are reduced to nitrogen. Then the CO₂ present in the stream of sample gas is withdrawn in an Na₂CO₃/NaOH trap and the water present in the stream of sample gas is withdrawn in an MgClO₄ trap. The change in the thermal conductivity of the
- 20 stream of sample gas compared with the stream of carrier gas is a measure of the nitrogen content of the sample.

F. Preparation of the mixtures

The mixtures were prepared in an internal mixer GK 1.5 E (product of Krupp Elastomertechnik, Hamburg). Cooling-water temperature 50°C; rotor speed 50 rpm; ram pressure 6 bar; proportion of internal mixer filled 70-80%, based on the volume of the mixing compartment.

Mixing procedure: The rubber is placed in the internal mixer. After an operating time of 1 minute, the remaining constituents are added. The internal mixer emptied at a batch temperature of >125°C. The peroxide is subsequently mixed on a roll mill (Krupp Elastomertechnik; diameter 200 mm, working width 350 mm) at a cooling-water temperature of 40°C.

The sheets for the determination of the mechanical properties were cross-linked/vulcanized under the stated conditions, between Teflon sheets, in a vulcanizing press (Krupp Elastomertechnik).

- 5 Although the invention has been described in detail in the foregoing for the purpose of illustration, it is to be understood that such detail is solely for that purpose and that variations can be made therein by those skilled in the art without departing from the spirit and scope of the invention except as it may be limited by the claims.

WHAT IS CLAIMED IS:

1. A rubber mixture comprising:
 - a) at least one nitrile rubber;
 - 5 b) at least one metal salt of an acrylate;
 - c) at least one liquid acrylate, optionally applied to a carrier, and
 - d) optionally other additives and/or fillers.
- 10 2. A rubber mixture according to Claim 1, wherein said at least one nitrile rubber is selected from the group consisting of NBR, partially hydrogenated NBR and completely hydrogenated NBR or mixtures of two or more of these.
- 15 3. A rubber mixture according to Claim 1, wherein said at least one metal salt of an acrylate is a zinc diacrylate or a zinc dimethylacrylate or a mixture.
4. A rubber mixture according to Claim 1, wherein the liquid acrylate is butane-
diol dimethacrylate or trimethylolpropane trimethacrylate or a mixture.
- 20 5. A rubber mixture according to Claim 1, wherein said rubber mixture also contains a siliceous filler, carbon black, zinc oxide, magnesium oxide or a mixture of two or more of these components.
- 25 6. A rubber mixture according to Claim 1, wherein said rubber mixture contains vulcanization retarders and/or vulcanization accelerators.
7. A cross-linkable rubber mixture comprising a rubber mixture, wherein said rubber mixture comprises:
 - 30 a) at least one nitrile rubber;
 - b) at least one metal salt of an acrylate;
 - c) at least one liquid acrylate, optionally applied to a support, and

d) optionally other additives and/or fillers.

- 5 8. A crosslinkable rubber mixture according to Claim 7 wherein said at least one nitrile rubber is selected from the group consisting of NBR, partially hydrogenated NBR and completely hydrogenated NBR or mixtures of two or more of these.
- 10 9. A crosslinkable rubber mixture according to Claim 7, wherein said at least one metal salt of an acrylate is a zinc diacrylate or a zinc dimethylacrylate or a mixture.
- 15 10. A crosslinkable rubber mixture according to Claim 7, wherein the liquid acrylate is butanediol dimethacrylate or trimethylolpropane trimethacrylate or a mixture.
11. A crosslinkable rubber mixture according to Claim 7, wherein said rubber mixture also contains a siliceous filler, carbon black, zinc oxide, magnesium oxide or a mixture of two or more of these components.
- 20 12. A crosslinkable rubber mixture according to Claim 7, wherein said rubber mixture contains vulcanization retarders and/or vulcanization accelerators.
- 25 13. A process for the preparation of a rubber mixture comprising the step of mixing in a mixing unit:
- a) at least one nitrile rubber;
 - b) at least one metal salt of an acrylate;
 - c) at least one liquid acrylate, optionally applied to a carrier, and
 - d) optionally other additives and/or fillers.
- 30 14. A process according to Claim 13, wherein said mixture is crosslinked.

15. A process according to Claim 14, wherein said mixture is crosslinked with a peroxide.
- 5 16. A molded article comprising a rubber mixture comprising:
- a) at least one nitrile rubber;
 - b) at least one metal salt of an acrylate;
 - c) at least one liquid acrylate, optionally applied to a carrier, and
 - d) optionally other additives and/or fillers.
- 10 17. A coating for a roller comprising a rubber mixture comprising:
- a) at least one nitrile rubber;
 - b) at least one metal salt of an acrylate;
 - c) at least one liquid acrylate, optionally applied to a support, and
 - 15 d) optionally other additives and/or fillers.
